

WORKSHOP: How to get the best use of a system

Jamie Coleman
Andrew Jones

27th March 2012

ICC, Birmingham

NIHR Programme Grant for Applied Research

University Hospital
Birmingham **NHS**
NHS Foundation Trust

Workshops

- * The Building Blocks
- * Making the case /
Managing
Implementation
- * **How to get the best
use of a system**

NIHR Programme Grant for Applied Research

University Hospital **NHS**
Birmingham
NHS Foundation Trust

Aims and Objectives

- * By the end of the workshop we will:
 - * Understand transformational change that ePrescribing can have to institutions
 - * Explore the secondary benefits of ePrescribing systems
 - * Discuss what additional work can be done to make systems better in the future

NIHR Programme Grant for Applied Research

University Hospital
Birmingham
NHS Foundation Trust

Introduction

- * Adopting ePrescribing is a strategic decision
 - * Quality and Safety often quoted as the key drivers
- * Lots of additional benefits other than digitising the drug chart
- * Requires clinical and technological input to realise many of the additional benefits
- * Journey – not a destination!

NIHR Programme Grant for Applied Research

University Hospital
Birmingham
NHS Foundation Trust

Doers, Window shoppers, Floggers

- * I am a ...

- * **Doer**

- * Got a system or about to implement

- * **Window Shopper**

- * Want a system, don't know which one

- * **Flogger**

- * System suppliers / providers

NIHR Programme Grant for Applied Research

University Hospital **NHS**
Birmingham
NHS Foundation Trust

Basic, Better, Best

- * Think of the BEST system or bits of a system you've seen (or supplied)
- * What are these BEST bits?
- * Why are they so good?

NIHR Programme Grant for Applied Research

University Hospital
Birmingham
NHS Foundation Trust

NIHR Programme Grant for Applied Research

University Hospital **NHS**
Birmingham
NHS Foundation Trust

Crystal Balls

What would you like ePrescribing systems to be able to do? Why?

- * Unlimited Money
- * Unlimited PC power
- * No liability

NIHR Programme Grant for Applied Research

University Hospital
Birmingham
NHS Foundation Trust

NIHR Programme Grant for Applied Research

University Hospital **NHS**
Birmingham
NHS Foundation Trust

How do we get there?

- * What do we need to provide the sorts of things you've discussed? (other than money, time and programmers)
- * What are the challenges to doing this in the NHS?

NIHR Programme Grant for Applied Research

University Hospital
Birmingham
NHS Foundation Trust

Some Thoughts from Us...

Integrating Clinical Evidence into ePrescribing Medicines Optimisation

NIHR Programme Grant for Applied Research

Integrating Clinical Evidence into ePrescribing

Dr Andrew Jones
Clinical Specialist
BMJ Group

The 4 critical predictors of clinical decision support success

<i>Feature</i>	<i>Adj. OR</i>
<i>Automatic provision of decision support as part of clinician workflow</i>	112
<i>Provision of decision support at time and location of decision making</i>	15
<i>Computer based generation of decision support</i>	6
<i>Provision of recommendation rather than just an assessment</i>	7

Table 1 - Features of CDSS associated with improved clinical practice

Current ePMA decision support

<i>Feature</i>	
<i>Automatic provision of decision support as part of clinician workflow</i>	✓
<i>Provision of decision support at time and location of decision making</i>	✓
<i>Computer based generation of decision support</i>	✓
<i>Provision of recommendation rather than just an assessment</i>	✗

Table 1 - Features of CDSS associated with improved clinical practice

- How do we develop recommendations for medication therapy?
- Published clinical evidence and systematic reviews are the source used in practice
- There are issues:
 - The burden of evidence is significant
 - Requires synthesis, interpretation and representation
 - Getting evidence into practice is notoriously difficult

Evidence into Practice

- It took 200 years before the Royal Navy routinely used lemon juice to prevent scurvy. First study 1601 ¹
- Routine use of thrombolytic therapy in acute MI early 1990s. The first RCT that showed the benefit late 1950s ²
- Antenatal corticosteroid use in preterm labour - 22 years for international guidelines to first recommended after first evidence ³
- On average it takes 17 years for 14% of clinical research to become routine practice ⁴

a. *Winters, E. Rapidly declining mortality from myocardial infarction in the United States: a 15-year update of the National Mortality Followback Survey. JAMA 1992;268(2):240-248.*

The burden of evidence is significant

...although figures vary

- 35,000 biomedical journal articles published annually
- 150,000 articles / month
- 120,000 RCT/year
- 500,000 articles are indexed in PubMed every year

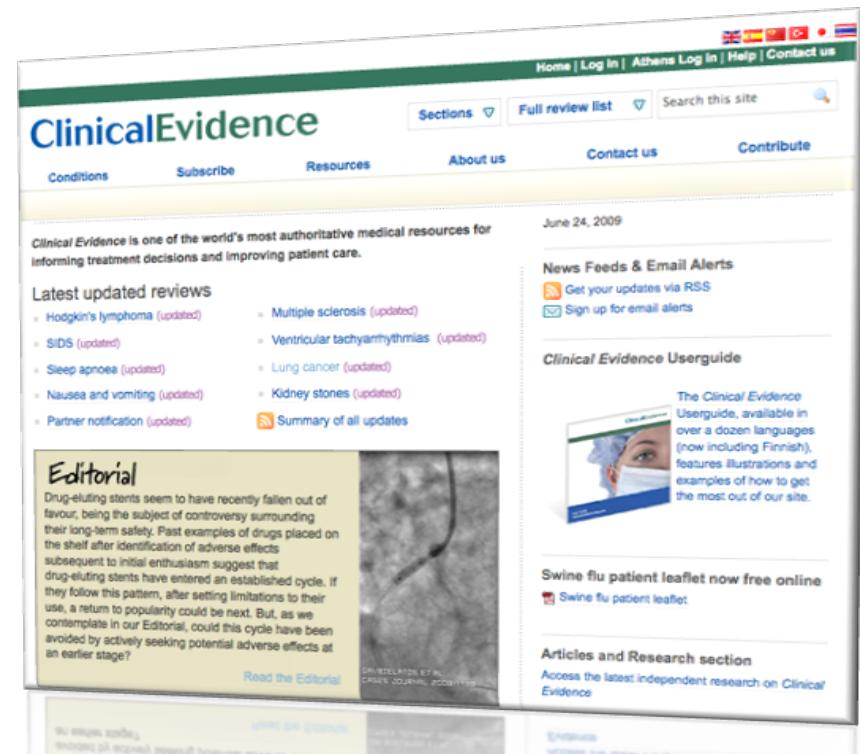

“The application of what we know already will have a bigger impact on health and disease than any drug or technology likely to be introduced in the next decade”

Sir Muir Gray
Chief knowledge officer of the NHS

ClinicalEvidence

- Systematic reviews of 3300 interventions
- First published in 1999
- Reaches more than a million clinicians worldwide in seven languages
- Updated monthly

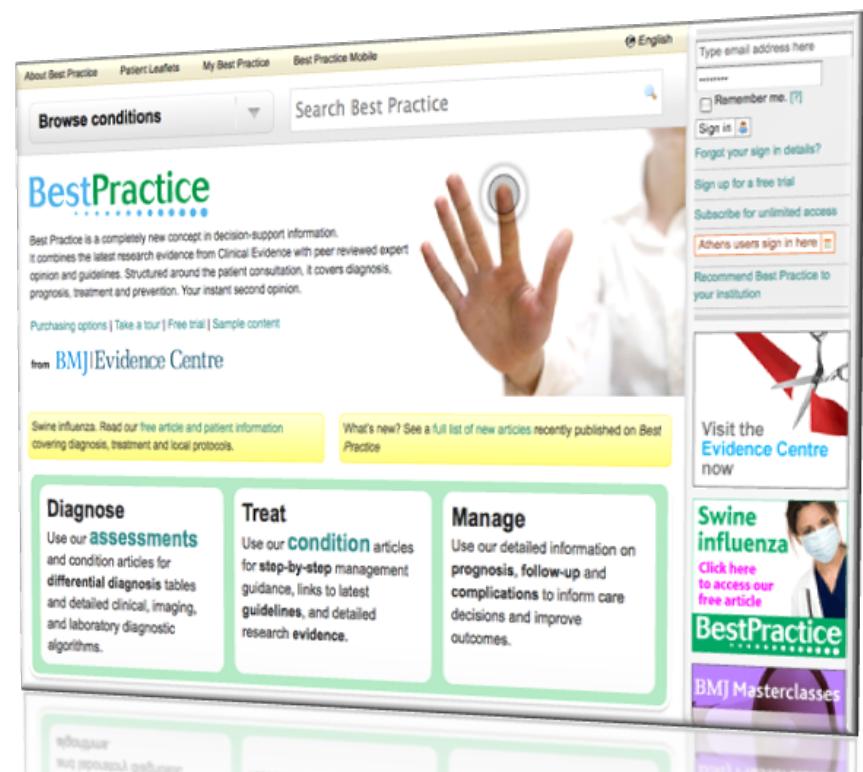

The screenshot shows the homepage of ClinicalEvidence. At the top, there is a navigation bar with links for Home, Log In, Athens Log In, Help, Contact us, Sections, Full review list, and a search bar. Below the navigation bar, the ClinicalEvidence logo is displayed, along with links for Conditions, Subscribe, Resources, About us, Contact us, and Contribute. A date, June 24, 2009, is shown. The main content area features a section titled "Latest updated reviews" with links to reviews on topics like Hodgkin's lymphoma, SIDS, Sleep apnoea, Nausea and vomiting, Partner notification, Multiple sclerosis, Ventricular tachyarrhythmias, Lung cancer, and Kidney stones. Below this is an "Editorial" section with a thumbnail image of a medical professional and a link to "Read the Editorial". To the right, there is a "Clinical Evidence Userguide" section with a thumbnail image of the guide and a description. Further down, there is a link to a "Swine flu patient leaflet now free online". At the bottom, there is a "Articles and Research section" with a link to "Access the latest independent research on Clinical Evidence".

BestPractice

- Evidence, expert opinion and guidelines
- Designed to fit the medical model
- Assessment, diagnosis, treatment, management
- Web interface designed to be used at the Point of Care

ActionSETS

CARE PROTOCOLS

FROM THE BMJ EVIDENCE CENTRE

- Order sets based on clinical evidence
- Organised into care protocols
- Covering up to 80% of acute admissions
- Evidence based reduction in mortality, cost and complication rate

BMJ Acute myocardial infarction (STEMI): Initial management after PCI or thrombolysis - CCU (Planned Pending)

- Lists of tests, medicines or other treatments required to diagnose and manage patients
- 523 sets covering over 150 conditions
- Evidence based **ClinicalEvidence BestPractice**
- Designed for order comms systems but can also be used for non-electronic processes
- Vendor agnostic knowledge base and can be implemented in any orders system

- Phased to divide the care pathway into appropriate care settings
- Include NICE guidelines and BNF Drug Information
- Deep links to the evidence and learning resources
- Generally customised by clients to meet local practice, formulary and guidelines
- Updated automatically as the evidence changes

Component Status Details

Patient Care

Cardiac Monitoring t:n, Once only, for 2, hour

Invasive Interventions

Peripheral IV Insertion Once only

Nursing Requests

Glucose Point of Care - Nursing Once only

Fluid Balance t:n, Every hour for 2 day(s)

Urine Pregnancy Test Point of Care if possibility of pregnancy, prior to potential diagnostic radiology

IV Solutions

Balance need for urgent IV fluid therapy in hypotension against risk of potential myocardial dysfunction

Dextrose 5% in Water 1,000 mL, IV

Sodium Chloride 0.9% 100 mL/hr, 500 mL, IV

Sodium Chloride 0.9% and Potassium Chloride 0.15% 1L

Sodium Chloride 0.9% and Potassium Chloride 0.3% 1L

Medications

Analgesics: Opioids

PROBABLE ACUTE CORONARY SYNDROME:

Reduce dosage in the elderly and use with caution in those with underlying cardiorespiratory conditions

CAUTION: Avoid NSAID use in suspected pericarditis following myocardial infarction

diamorphine 2.5 mg, IV, Injection, Every four hours, chest pain

morphine (CD) 10 mg, IM, Soln, Every four hours, initial dose; increase frequency

Component Status Details

TARGET: NSF for Coronary heart disease: All eligible patients with acute MI to receive thrombolysis within 30 minutes of arrival

TARGET: NHS IC: CV36 - Percentage of ST-elevation myocardial infarction (STEMI) patients who received thrombolytic treatment within 60 percentage of STEMI patients who received primary angioplasty within 120 minutes of call (call to balloon time)

Notify Cardiac Cath Lab

See evidence summary for scope, references and relevant performance measures

Medications

Anticoagulants

REPERFUSION NOT PLANNED:

dalteparin 120 unit/kg, Subcutaneous, Soln, Every twelve hours

THROMBOLYSIS PLANNED:

heparin 60 unit/kg, IV, Injection, Once only, loading dose; maximum of

Heparin 25,000 units/D5W 500mL 500 mL, IV, -1, Routine, T,N, 48 hour, [1,000 U/h maximum] a 70 s; continue for 48 hours

dalteparin 120 unit/kg, Subcutaneous, Soln, Every twelve hours

enoxaparin Age under 75 years, thrombolysis planned: 30 mg, IV, Injection, Once only, bolus

enoxaparin Age over 75 years, thrombolysis planned: 0.75 mg/kg, Subcutaneous, Injection, Twice a day, no loading

enoxaparin Creatinine clearance less than 30 mL/min; thrombolysis planned: 1 mg/kg, Subcutaneous, Injection, Once a day

PRIMARY PCI PLANNED:

bivalirudin 0.1 mg/kg, IV, Injection, Once only, bolus, on admission

enoxaparin 1 mg/kg, Subcutaneous, Injection, Every twelve hours

ENOXAPARIN SODIUM

Additional information interactions ("Enoxaparin").

Indications see notes above and under preparations

Cautions see under [Heparin](#) and notes above; low body-weight (increased risk of bleeding)

Contra-indications see under [Heparin](#)

Hepatic impairment manufacturer advises caution—no information available

Renal impairment risk of bleeding increased; reduce dose if eGFR less than 30 mL/minute/1.73 m²—consult product literature for details; monitoring of anti-factor Xa may be required; use of unfractionated heparin may be preferable

Summary

Chest pain is a common chief complaint, accounting for 5% to 8% of all emergency department visits in the US per year, [1] and is the presenting complaint in 1% to 2% of office-based visits. [2] In general practice in the UK, the incidence of newly diagnosed chest pain is 15.5 per 1000 person-years. [3]

Chest pain may be caused by either benign or life-threatening aetiologies and is usually divided into cardiac and non-cardiac causes. Acute coronary syndrome (ACS) encompasses unstable angina and MI. ACS affects only a few of the patients presenting with chest pain, but excluding ACS is vital because of the mortality associated with untreated MI.

Urgent considerations

See Differential Diagnosis for more details

Acute chest pain warrants rapid clinical assessment, as underlying disease can be life-threatening. Continuous monitoring of pulse, BP, and oxygen saturation is standard care. If the patient is in pain or breathless, or oxygen saturation is <90%, high-flow oxygen should be given. Morphine (IV) may also be necessary to relieve severe pain.

Initial investigations include a 12-lead ECG, CXR, cardiac biomarkers, CBC, and renal profile. The patient may need to be transferred to an intensive care setting. Once the patient is stable, further tests such as a V/Q scan, echocardiography, CT, or angiography should be requested to confirm clinical suspicion.

Acute coronary syndrome

Acute coronary syndrome (ACS) refers to acute myocardial ischaemia caused by atherosclerotic coronary disease and includes ST-elevation MI (STEMI), non ST-elevation MI (NSTEMI), and unstable angina (UA). These terms are used as a framework for guiding management.

Red flags

- Acute coronary syndrome
- Pulmonary embolism
- Pneumonia
- Cardiac tamponade
- Aortic dissection
- Aortic stenosis
- Mitral valve prolapse
- Pneumothorax
- Acute cholecystitis
- Pancreatitis

The aim is to deliver:

- Consistent evidence based care
- That can be delivered by every member of staff
- Rapid dissemination of new evidence
- And practice based knowledge
- While learning at the same time

Properly implemented can reduce mortality, length of stay, costs and readmissions

The Evidence

- Quantitative study into the impact of care bundles in a north west London NHS trust ¹
- Eight care bundles implemented which targeted 13 diagnoses
- Over one year period admissions increased 5.7%
- Deaths would have been expected to rise by 7.9%
- There was a 14.5% decrease in actual deaths which represented 255 fewer deaths

1. Robb E, Jarman B, Suntharalingam G, Higgens C, Tennant R, Elcock K. *Using care bundles to reduce in-hospital mortality: quantitative survey*. BMJ. 2010 Mar 31;340:c1234

- Journal General Internal Medicine, 2010. Chang et al ¹
- Systematic review of studies relating to order sets
- June 1999 – June 2009
- 23 studies identified: 16 examined the effect of order sets on outcomes
- Outcomes measured included mortality, length of stay, appropriate medication use, medication errors, glucose control, and increased adherence to recommended care

1. Chang J, Langberg M, Silka P, Dietrich A. *Improving outcomes through the use of inpatient order sets: a systematic review*. J Gen Intern Med. 2010 Jun; 25(Suppl 3): S308-S309

- Of the 16 that measured outcomes, 14 (88%) demonstrated improved clinical outcomes or adherence to guidelines
- 4 studies showed reduced mortality
- 4 studies demonstrated a reduced length of stay or costs
- Various conditions studied including acute myocardial infarction, pneumonia, sepsis, venous thromboembolism (VTE) prophylaxis, diabetes, and immunizations

1. *Chang J, Langberg M, Silka P, Dietrich A. Improving outcomes through the use of inpatient order sets: a systematic review. J Gen Intern Med. 2010 Jun; 25(Suppl 3): S308-S309*

RFH Pilot

- Royal Free Hospital pilot of BMJ Action Sets targeting the management of upper GI bleeding
- Examined two quality indicators in the initial management
 - Rockall Scores and use of i.v. proton pump inhibitors
- Rockall scoring is a simple risk assessment tool which takes account of age, signs of shock and co-morbidity ¹
- Patients with a score of 0 or 1 have <1% mortality ²

1. *Risk assessment after upper gastrointestinal haemorrhage complications of fast bolus gentamicin. HB Bahgat, SJ Field, VOrn Buti, TSO 2006; 38(2): 110-2. 12000 Aug 11; 113(1115):331-3.*

RFH Pilot - data

- 0% of acute clinicians calculated a Rockall score on admission
- 0% of gastroenterology clinicians calculated a Rockall score on admission
- 50% of inpatient endoscopy patients had a Rockall score of 0 (length of stay 3-5 days)
- 65% of patients received i.v. pantoprazole pre-endoscopy

1. *Unpublished data from the Royal Free Hospital, presented at the Cerner Health Conference by Dr James O'Bierne, September 2010*

- RFH implemented the BMJ upper GI bleed Action Set in Cerner Millennium system
- Adapted it to their organisation
- Recent data presented at the BSG:
 - Rockall score recorded – 33%
 - Discharge from A&E if Rockall score 0 – 100%
 - Inappropriate PPI use – 67% reduction

1. ***THERE WILL BE BLOOD... A COMPLETE AUDIT CYCLE.*** M. Pericleous, C. Murray, M. Hamilton, O. Epstein, R. Negus, J. O'Beirne. BSG 2011 - Abstract Submission, Health Service Research and IT BSG11-ABS-2046

- Properly implemented order sets have the potential to:
 - Improve outcomes
 - Standardise care
 - Reduce costs
 - Improve Patient Safety
 - Deliver evidence based practice more quickly

Medicines Optimisation

NIHR Programme Grant for Applied Research

Medicines Optimisation

Derived from FirstDataBank's Product Definition

- * Encompasses:

- * Provision of medicines usage in order to identify deviations from best practice and the cost of those deviations, long term conditions which require interventions, and opportunities for further medicines swapping and cost savings
- * Support Prescribers to make effective medicines choices depending on patient characteristic, optimal pricing and current NHS best practice guidelines
- * Enable the health service to make the best use of available medicines budgets

NIHR Programme Grant for Applied Research

University Hospital
Birmingham
NHS Foundation Trust

The Fourth Hurdle

Sir Mike Rawlins

Formulary Decision Support: The Evidence

- * US study examining community prescribing systems
- * Adjusted 3.3% increase in tier 1 (more cost effective) medication due to ePrescribing
- * Savings of \$845,000 per 100,000 patients

Effect of Electronic Prescribing With Formulary Decision Support on Medication Use and Cost

Michael A. Fischer, MD, MS; Christine Vogeli, PhD; Margaret Stedman, MPH; Timothy Ferris, MD, MPH; M. Alan Brookhart, PhD; Joel S. Weissman, PhD

Background: Electronic prescribing (e-prescribing) with formulary decision support (FDS) prompts prescribers to prescribe lower-cost medications and may help contain health care costs. In April 2004, 2 large Massachusetts insurers began providing an e-prescribing system with FDS to community-based practices.

Methods: Using 18 months (October 1, 2003, to March 31, 2005) of administrative data, we conducted a pre-post study with concurrent controls. We first compared the change in the proportion of prescriptions for 3 formulary tiers before and after e-prescribing began, then developed multivariate longitudinal models to estimate the specific effect of e-prescribing when controlling for baseline differences between intervention and control prescribers. Potential savings were estimated using average pre-medication costs by formulary tier.

Results: More than 1.5 million patients filled 17.4 million prescriptions during the study period. Multivariate

models controlling for baseline differences between prescribers and for changes over time estimated that e-prescribing corresponded to a 3.3% increase (95% confidence interval, 2.7%-4.0%) in tier 1 prescribing. The proportion of prescriptions for tiers 2 and 3 (brand-name medications) decreased correspondingly. e-Prescriptions accounted for 20% of filled prescriptions in the intervention group. Based on average costs for private insurers, we estimated that e-prescribing with FDS at this rate could result in savings of \$845 000 per 100 000 patients. Higher levels of e-prescribing use would increase these savings.

Conclusions: Clinicians using e-prescribing with FDS were significantly more likely to prescribe tier 1 medications, and the potential financial savings were substantial. Widespread use of e-prescribing systems with FDS could result in reduced spending on medications.
